# LEXSKILL AI

Practical Legal Skills Assessment
& Institutional Intelligence

## Product & Institutional Development Report

*A proposal for law schools, on how AI-assisted practical-skills assessment can work under faculty control.*

**PREPARED FOR**

Law Schools
National Law Universities
Legal Educators
Judicial & Legal Professionals
Institutional Partners

**DATE**

September 2026

**VERSION**

1.0

*Evidence tags used throughout: [FACT] [EST] [ASSUMP] [INFER] [CO. CLAIM] [OPINION]. Anything unverified is marked "Not independently verified".*
*Text extracted from the founders' brief; the uploaded index.html is only a front-end shell (js/css not provided) and was not used as evidence of product maturity.*

# READ THIS FIRST

**For a non-technical legal professional. One page.**

**What is it?** LexSkill AI is a proposed software system for law schools. A teacher sets a practical legal task (for example, draft a legal notice, or research and cite authorities for a moot problem). Students do the task. The software gives the teacher a first-pass evaluation against the teacher's own marking rubric and checks every case, statute and citation the student relies on against a legal source. **The teacher then reads, corrects and finalises every mark.** Nothing reaches a student's record without faculty approval.

**Why might a law school want it?** Indian law programmes already require practical courses such as drafting, pleading, moot court, ADR and internships [FACT][S1]. The difficulty is not whether these are taught; it is that marking them is slow, uneven from one examiner to another, and hard to summarise across a batch. A Dean cannot easily answer "how well does this batch draft?" with anything more than marks in a register. That is the gap LexSkill AI aims at. **Whether this gap is painful enough for institutions to pay to close it has not yet been proven** [ASSUMP].

**Why now?** Courts are treating fake AI-generated citations as serious misconduct. In 2026 the Supreme Court set aside tribunal orders that rested on non-existent judgments and said that citing unverified AI material is misconduct by an advocate [FACT][S4][S5]. A law school that wants graduates who verify authorities before citing them needs a way to teach and test that habit.

**Is it a chatbot?** No. It does not answer legal questions for students, give legal advice, or decide grades. It is an assessment and record-keeping layer, with AI used as a fast, tireless first reader.

**What does the evidence say about AI marking?** A peer-reviewed US study found that, given a detailed rubric, an AI model's law-exam scores tracked professors' scores closely (correlation up to 0.93) [FACT][S9]. That is encouraging but it concerns US exam essays, not Indian drafting tasks; the authors themselves see AI as a support to, not replacement for, faculty. Indian calibration is a required pilot step [INFER].

**What are the main risks?** (1) AI can be wrong or biased in marking; hence faculty control and measured agreement. (2) Student data must be protected under India's new data-protection law, whose main duties begin on 14 May 2027 [FACT][S3]. (3) Take-home tasks can be completed by AI; assessments therefore need supervised or process-tracked design [INFER][S13]. (4) It may not be worth the cost to an institution. That is tested through a 30-day pilot with pre-stated pass/fail criteria (Part 11).

**What do we ask of a partner institution?** One faculty champion, one course, one cohort, about 30 days, and honest measurement. In return: a supervised pilot, no lock-in, no student data retained beyond the pilot without written agreement.

# 1. Executive Summary

LexSkill AI is an institutional platform that helps a law school **assess practical legal skills, give structured feedback, verify citations, and see competency patterns across a cohort**, while keeping every academic decision with faculty. It is designed as infrastructure for the teaching institution, not as a consumer study aid and not as a legal research database.

| Question | Short answer |
|---|---|
| What is the product? | An assessment workflow: faculty create a rubric-based task, students submit, AI produces a first-pass evaluation and a citation check, faculty review and finalise, and results feed a student skills record and institutional analytics. |
| Who uses it? | Faculty (primary daily users), students, Deans and department heads (analytics), administrators (setup, permissions, data controls). Placement cells are a later audience. |
| What problem does it address? | Practical-skills assessment is labour-intensive, inconsistent between markers, and rarely aggregated for programme-level decisions. Evidence for the size of this problem in India is partial; see Part 2 [INFER]. |
| How is AI used? | As a first reader against faculty-defined rubrics; as a citation and authority checker linked to legal sources; and as a summariser of patterns. It is never the final authority. |
| What does the institution gain? | Faster, more consistent marking; earlier, structured feedback for students; evidence for outcome reporting; and a defensible record that citation verification is being taught and tested. |
| What must be proven before scale? | That AI-assisted marking saves faculty real time at acceptable agreement with faculty; that students engage; and that institutions will fund it. None of these is proven today [ASSUMP]. |

> **Design principle: AI assists. Faculty decides.**
> Every score the student sees is a faculty score. AI output is labelled as a draft, shows its evidence, and can be overridden without penalty. The system records who changed what and why.

# 2. The Context: Practical Skills in Indian Legal Education

## 2.1 What already exists

The Bar Council of India has told Parliament that its curriculum provides for compulsory clinical education in Drafting, Pleading and Conveyance, Professional Ethics, ADR, Moot Court and Internship, with visits to courts, police stations and jails encouraged [FACT][S1]. Mediation has also been made compulsory [FACT][S1]. Practical training therefore **exists in the regulatory design**. This report does not claim that law schools fail to teach practical skills.

## 2.2 What the evidence says is uneven

The same Parliamentary Standing Committee report records concerns that fit an assessment-and-measurement gap, though none of them is about assessment tools directly:

- It cites about 1,700 law schools, and says only a few are serious research institutions; it records difficulty in hiring qualified faculty [FACT][S1].
- It notes that curricula differ across affiliating universities, creating unevenness among graduates [FACT][S1].
- It recommends that a large share of legal education (it suggests fifty per cent) should be practical training, and that legal-tech and AI literacy be added [FACT][S1].
- On accreditation, it reports only three law universities and twenty law colleges holding valid NAAC accreditation, and a Rs 6 lakh assessment fee for law institutions against Rs 2 lakh for ordinary colleges; it observes that institutions not used to record-keeping struggle to evidence quality [FACT][S1].

**Inference.** If practical training is to be expanded and evidenced, institutions will need reliable, comparable records of student performance on practical tasks. Today that record is usually a mark in a register [INFER]. This is a hypothesis about the gap; direct evidence from Deans and faculty is the first item in the validation plan (Part 11).

## 2.3 Why the timing matters

Between February and July 2026 the Supreme Court addressed AI-generated fake authorities in *Gummadi Usha Rani v. Sure Mallikarjuna Rao* and *Pooja Ramesh Singh v. J&K; Bank Ltd* (2026 INSC 668), characterising reliance on fabricated precedents as misconduct and directing the Bar Council of India to frame guidelines on AI use by advocates [FACT][S4][S5]. Law schools now have a clear reason to teach and evidence **authority verification** as a professional skill. Details of these judgments are taken from secondary reports; institutions should read the judgments themselves [NOT VERIFIED].

# 3. Product Definition

**One sentence**

LexSkill AI is an institutional practical legal-skills assessment and intelligence layer for law schools, in which AI prepares first-pass evaluations and citation checks and faculty make all final decisions.

### 30 seconds

Faculty set a legal task and a rubric. Students submit. The system reads each submission against the rubric, checks the authorities cited, and prepares comments for the teacher. The teacher reviews, adjusts and approves. Approved results build each student's skills record and give the Dean a batch-level view.

### 1 minute

Practical papers such as drafts, research notes and moot memorials take faculty hours to mark, and different markers weigh things differently. LexSkill AI standardises the first read: it scores against the teacher's rubric, flags missing issues, weak reasoning, drafting defects and unverifiable or misquoted citations, and gives the teacher a draft. The teacher remains the examiner. Over a semester the platform shows which skills a cohort is strong or weak in, so the institution can adjust teaching.

### 5 minutes

The platform has four layers. (1) **Assessment design**: a task, a marking rubric, submission rules and integrity settings. (2) **AI-assisted evaluation**: a language model reads the submission with the rubric and, where relevant, retrieved legal sources, and returns structured, evidence-cited feedback and a suggested score. (3) **Verification**: each case, statute or article cited is extracted and checked against a legal source; each is marked verified, not found, or found-but-does-not-support-the-proposition. (4) **Faculty review and records**: the teacher sees the AI draft side by side with the submission, edits or overrides it, and finalises. Approved results update the student profile and, in anonymised aggregate, the institutional dashboard. All AI outputs and faculty edits are logged. The first release deliberately covers one skill, legal drafting, to be done well before extending to research, oral and simulated exercises.

### One page

LexSkill AI does not teach law, replace databases such as SCC Online or Manupatra, give legal advice, or grade students by itself. Its purpose is narrower: to make practical-skills assessment faster, more consistent and more visible to the institution, in a way that respects the examiner's authority and the student's privacy. It reflects three commitments: **faculty authority** (no unreviewed AI mark reaches a record); **evidence over assertion** (each AI comment cites the passage that triggered it; each authority is checked); and **measured reliability** (agreement between AI and faculty is reported per rubric criterion, and criteria where AI is unreliable are switched off rather than trusted).

# 4. Users, Roles and Authority

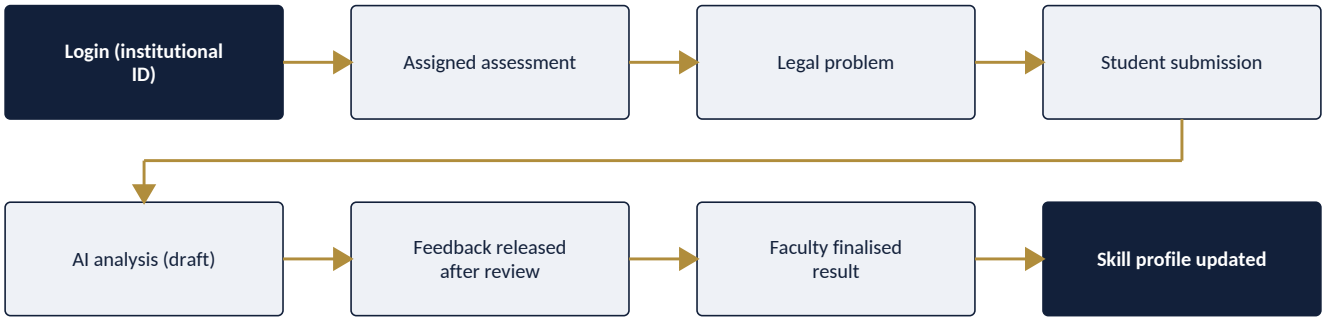

| Role | Main tasks | Can decide | Cannot do |
|---|---|---|---|
| Student | Receive task; submit; read feedback; request review; view own skill profile | Whether to submit; whether to request re-evaluation | See other students' work; alter results |
| Faculty / examiner | Create tasks and rubrics; review AI drafts; override; finalise | All scores and comments shown to students | Change institution-wide settings |
| Department head / Dean | View cohort analytics; approve rubric templates; export reports | Programme-level interventions | Edit individual finalised scores (any change is a logged exception) |
| Administrator (registrar / IT) | Users, courses, cohorts, permissions, retention and export controls | Data-retention configuration within policy | Read content of assessments unless granted |
| Institutional counsel / DPO | Review data-protection notices, consent flows, vendor terms | Approval to go live | n/a |

*The buyer, champion, blocker and procurement roles are analysed in the companion Business & Feasibility Study.*

# 5. How the System Works: Workflows

## 5.1 Student flow

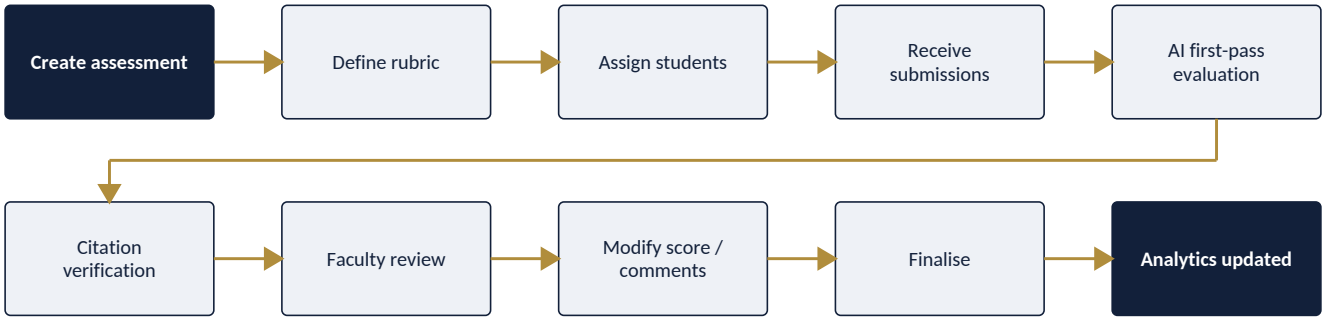

**Student journey**

Students see AI-generated comments only after faculty release, unless the teacher enables a formative "practice mode" that is clearly marked non-graded. Students can flag a comment for faculty attention.

## 5.2 Faculty flow

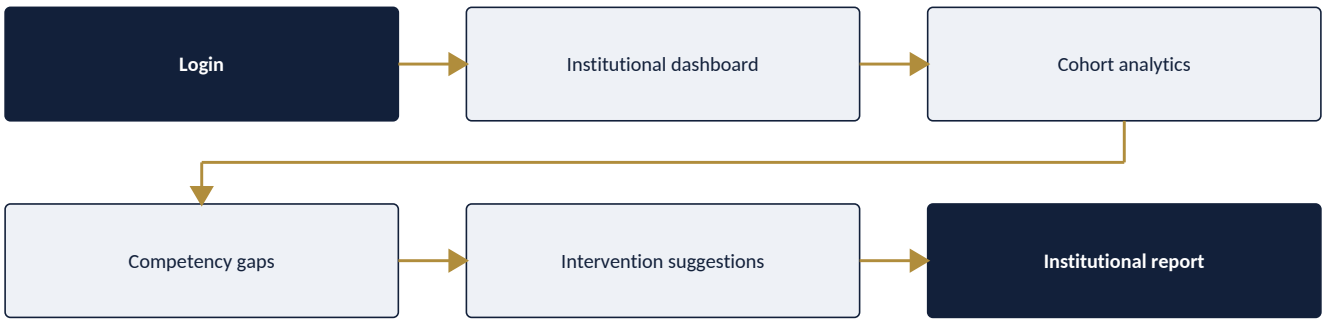

**Faculty journey**

The faculty review screen puts the submission on the left and the AI draft on the right. Each AI comment links to the passage it refers to. Citation flags show a source excerpt. One click accepts, edits or rejects each comment; total time per submission is recorded so that the claim of time saved can be measured rather than asserted.

## 5.3 Dean flow

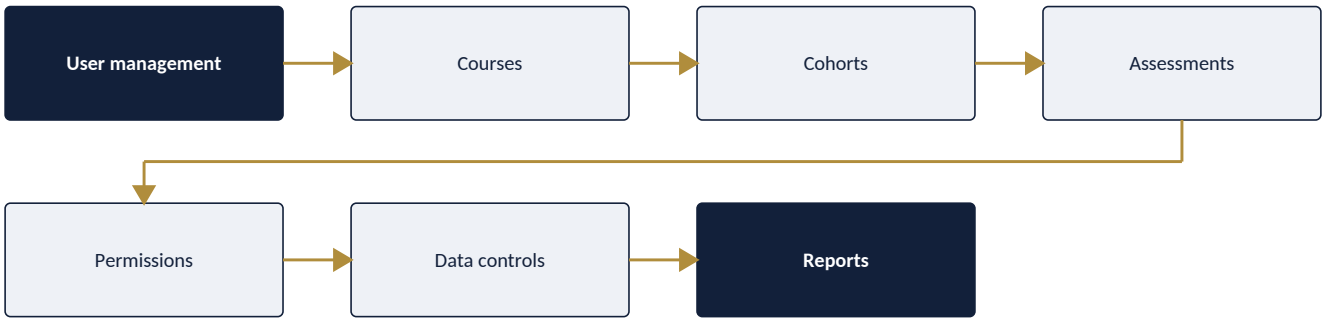

**Dean journey**

Dean views show **aggregate** results by cohort, course and skill dimension. Access to identifiable student work is a separate, logged permission. "Intervention suggestions" are prompts for academic discussion (for example, "citation accuracy is low in Semester 4 drafting"), not automated decisions.

## 5.4 Administrator flow

Administrator journey

# 6. Product Modules

Twelve modules were considered. Only the first release scope is recommended for build; the rest are staged and each must earn its place by pilot evidence.

| Module | Problem addressed | Primary user | Complexity | Stage |
|---|---|---|---|---|
| 1 Legal drafting assessment | Slow, uneven marking of drafts (notices, pleadings, agreements) | Faculty, student | Medium | **MVP** |
| 2 AI faculty evaluation | First-pass scoring and comments against a rubric | Faculty | Medium-high | **MVP** |
| 3 Citation / authority verification | Unverifiable or misquoted authorities | Faculty, student | High (source access) | **MVP** (narrow scope) |
| 4 Legal research assessment | Testing research method, not just result | Faculty | Medium-high | Later (month 4-6) |
| 5 AI viva | Oral questioning at scale | Faculty, student | High (speech, bias, voice data) | Later (year 2, if evidence) |
| 6 Moot court simulation | Practice for oral advocacy | Student | High | Not planned; university-built and specialist tools exist [FACT][S29][S30] |
| 7 Client-interview simulation | Interviewing and counselling skill | Student | High | Not planned |
| 8 Student skill profile | Longitudinal record of competency | Student, faculty | Low-medium | **MVP** (basic) |
| 9 Faculty dashboard | Workload and review queue | Faculty | Low | **MVP** |
| 10 Institutional analytics | Cohort-level skill patterns | Dean | Medium | **MVP** (basic) |
| 11 Placement intelligence | Readiness signals for placement cells | Placement director | Medium; validity risk | Not before year 2; no predictive claims |
| 12 Institutional reporting | Accreditation/outcome reports | Dean, registrar | Low-medium | MVP export; templates later |

*Modules 5-7 are excluded from the first release because they carry the highest technical, privacy (voice recordings) and evidence burden, and existing tools already cover parts of them.*

# 7. How AI Is Used

## 7.1 What the AI evaluates in a drafting task

| Dimension | What the AI looks for | Reliability expectation | Notes |
|---|---|---|---|
| Issue spotting | Are the material legal issues in the facts addressed? | Moderate-high with a faculty checklist | Rubric lists expected issues; AI matches |
| Application of law | Is the correct provision/principle applied to the facts? | Moderate; needs retrieved sources | Highest risk of confident error |
| Drafting quality | Structure, completeness of clauses/prayers, defined terms, internal consistency | Moderate-high | Format norms come from faculty templates |
| Argument structure | Logical sequence, whether reasoning supports the prayer | Moderate | Subjective; larger human override expected |
| Citation accuracy | Does each authority exist, and support the stated proposition? | High for existence; moderate for proposition | Handled by the separate verification pipeline |
| Professional language | Register, clarity, precision | Moderate-high | Do not penalise legitimate regional-language or stylistic choices without faculty consent |

## 7.2 How the AI is instructed

- **Rubrics, not free judgement.** Each criterion has descriptors for score bands, written by faculty. The model must score criterion by criterion and quote the submission passage that justifies each score. Detailed rubrics are what drove strong AI-faculty agreement in the published US study [FACT][S9].

- **Structured outputs.** Responses are constrained to a fixed schema (criterion, score, evidence quote, comment, confidence) so they can be validated automatically and displayed consistently.
- **Source grounding (RAG).** When a criterion depends on law, the system retrieves relevant statute text or judgments from an authorised source and asks the model to rely only on that text; if nothing is retrieved, the model must say so rather than guess.
- **Confidence and abstention.** Low-confidence criteria are highlighted for closer faculty attention. The model is permitted, and prompted, to say "cannot assess".
- **Calibration before use.** Before a rubric is used live, faculty mark a sample independently; the system compares AI to faculty per criterion. Criteria below the agreed threshold are set to "faculty only".
- **Model comparison.** More than one model can be tested on the same calibration set; the institution's chosen configuration is recorded in the audit log. Model versions are pinned so results are reproducible.

## 7.3 What the AI is not allowed to do

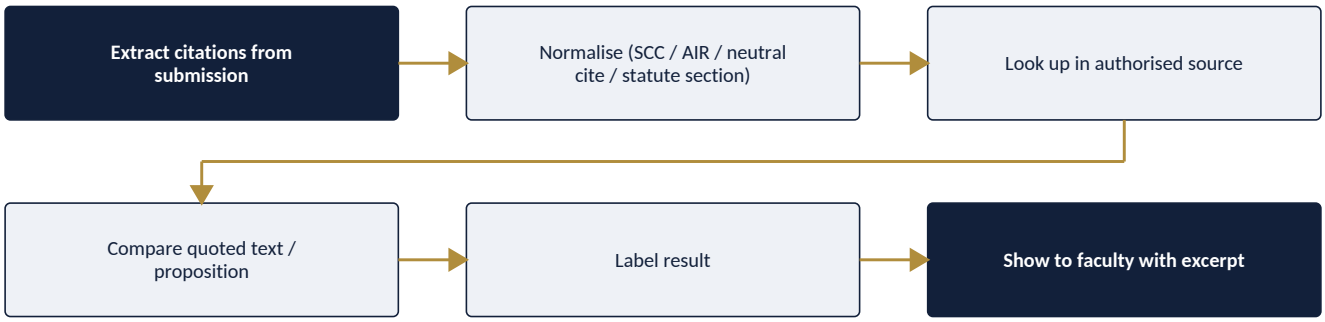

- Assign or publish a final grade.
- Cite a legal authority that it has not retrieved from an authorised source.
- Make judgements about a student's honesty; it may only present objective indicators (for example, similarity or process-log anomalies) for a human integrity process.
- Produce placement rankings or predictions of job performance. No evidence supports that use at present [ASSUMP].

> **Evidence note**
> The strongest published evidence found (Cope et al., peer-reviewed, US top-30 law school exams) shows high AI-human agreement when rubrics are detailed [FACT][S9]. Only the abstract was reviewed. No comparable Indian study of drafting or moot assessments was found in this research pass [NOT VERIFIED]. Indian calibration is therefore a first-order product requirement, not an optional enhancement.

# 8. Citation and Authority Verification

Fake citations are the failure that courts have now named as misconduct [FACT][S4][S5]. The verification module therefore has a narrow, checkable job.

### Verification pipeline

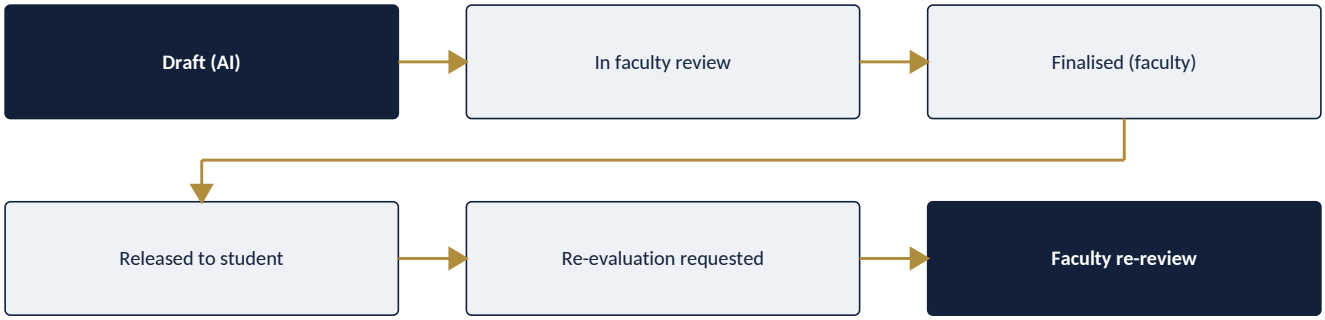

| Result label | Meaning | Faculty action |
|---|---|---|
| Verified | Authority found; citation details match | None required |
| Found, mismatch | Case exists but year/court/parties differ, or quotation is inexact | Confirm; possible marking deduction |
| Found, proposition unsupported | Case exists but the cited passage does not say what the student states | Review; typically the most serious |
| Not found | No matching authority in the sources consulted | Check manually; source coverage may be the cause |
| Cannot check | Source not available in the connected library | Manual check |

**Limits.** Verification is only as good as the legal sources connected to it. Full Indian reporter databases are commercial (SCC Online, Manupatra and others); their terms of use for this purpose have not been reviewed [NOT VERIFIED]. Free official sources exist but coverage, formats and reliability vary and must be tested. "Not found" therefore never means "fake" on its own; it means "unverified in the sources consulted". Institutions that already subscribe to a database may prefer to connect through it, subject to licence terms; this is a contractual matter for counsel.

# 9. Human-in-the-Loop Design

| AI may | Faculty must |
|---|---|
| Suggest scores and comments against the rubric | Review each suggestion and approve, edit or reject it |
| Highlight passages, gaps and possible errors | Decide whether a highlighted point is an error |
| Verify citations against sources and label results | Resolve "not found" and "unsupported" labels |
| Summarise patterns in a cohort | Decide what, if anything, to do about them |
| Draft feedback text | Own the feedback that is sent to the student |

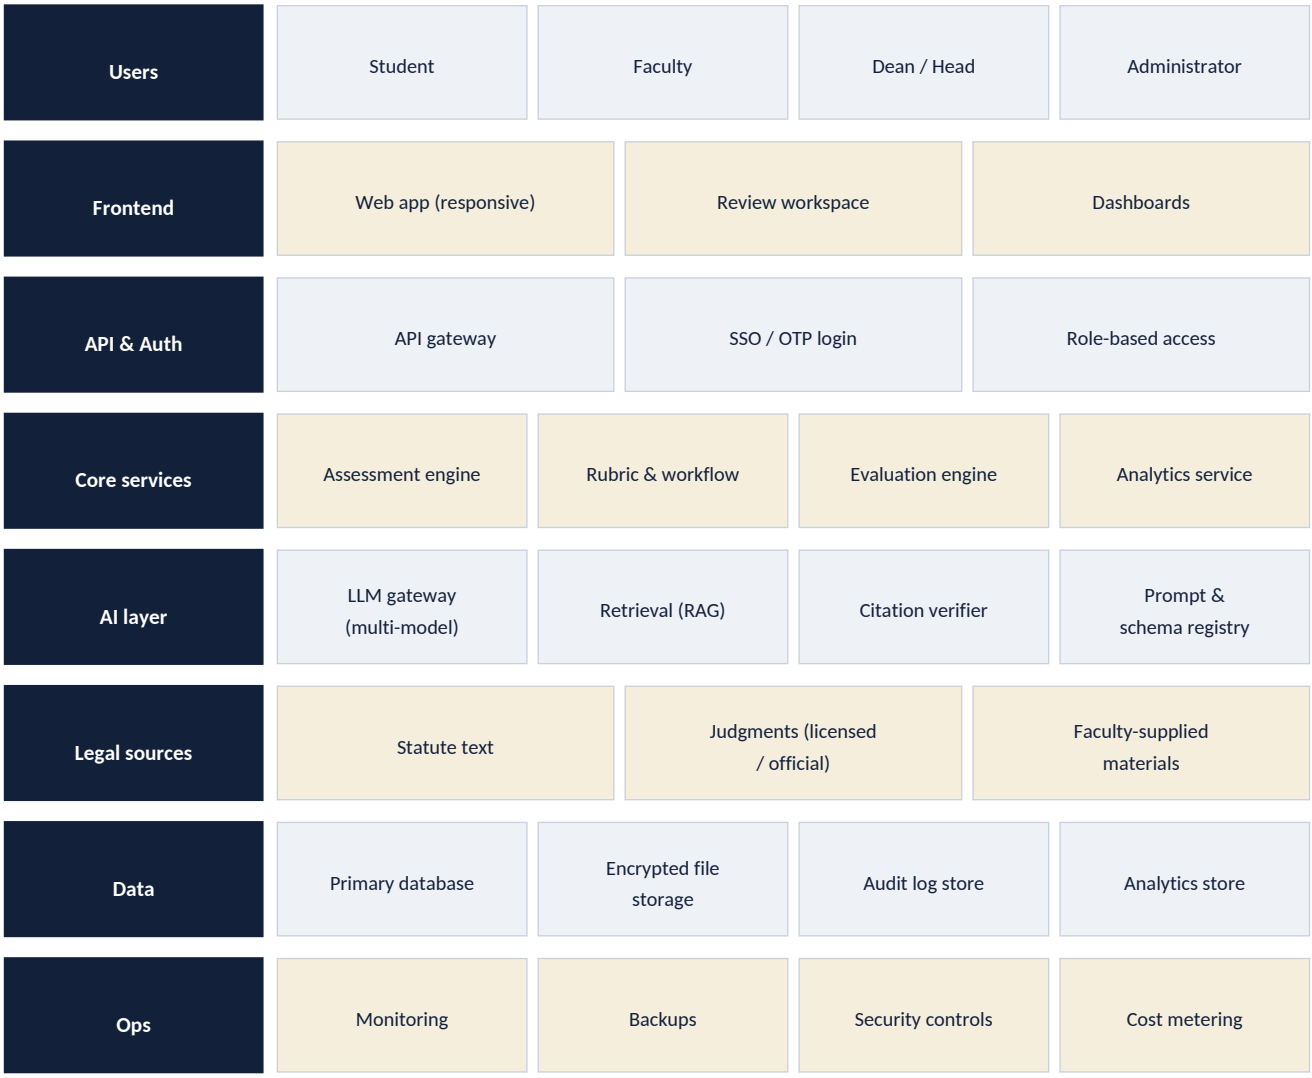

### Result status: no state skips faculty review

- **Why this is safer.** Errors by the AI are caught before they affect a student; responsibility for a mark stays with an identifiable examiner; the institution's existing grievance and re-evaluation rules continue to apply.

- **Why institutions can accept it.** It does not change who holds academic authority under university statutes; it changes only the preparation work. This is a matter for each institution's own academic council to confirm [NOT VERIFIED].
- **Automation bias.** A known risk is that reviewers over-trust AI drafts. Mitigations: AI scores hidden until the faculty member has written an initial view (optional "blind first" mode); random spot-audits of accepted drafts; reporting of override rates by faculty and criterion.
- **Audit trail.** Every AI output, prompt version, model version, source retrieved, faculty edit and timestamp is stored and exportable for a grievance panel.

# 10. Technical Architecture

| Component | Design choice | Reason |
|---|---|---|
| Frontend | Web application usable on laptop and mobile browser | No installation; typical for institutional IT |
| Backend / API | Modular monolith with clear service boundaries | Small team; avoids premature microservices |
| Database | Relational (PostgreSQL) for users, courses, rubrics, results; separate append-only audit table | Integrity and queryability for reports |
| Authentication | Institutional email/SSO where available; OTP fallback; role-based access control | Colleges vary in identity infrastructure |
| LLM layer | Provider-agnostic gateway; pinned model versions; structured (schema) outputs; per-institution usage metering | Avoids vendor lock-in; reproducibility; cost control |
| Retrieval / legal source layer | Indexed statute text and permitted judgment sources; source ID stored with every retrieved passage | Grounding and traceability |

| Component | Design choice | Reason |
|---|---|---|
| Citation verification | Rule-based citation parser plus source lookup plus model check for proposition support | Existence checks must not depend on the model |
| File storage | Encrypted object storage; region and retention configurable | Data-protection compliance |
| Audit & monitoring | Immutable event log; quality dashboards (agreement, override rate, latency, cost) | Accountability and continuous calibration |
| Security | Encryption in transit and at rest; least-privilege access; secrets management; vulnerability testing before pilots; breach-response runbook | Baseline expected of institutional vendors |

*Hosting location, cloud provider and model provider are open decisions that depend on institutional data-residency and procurement preferences and on counsel's advice* [NOT VERIFIED].

# 11. Privacy, Legal Position and Governance

## 11.1 Data protection

India's Digital Personal Data Protection Rules, 2025 were notified on 14 November 2025 with three dates: 14 Nov 2025 (Board and definitions), 14 Nov 2026 (consent-manager registration) and 14 May 2027 (main obligations including notices, security safeguards, breach reporting and children's data) [FACT][S3]. A penalty of up to Rs 250 crore is prescribed for failure to take reasonable security safeguards [FACT][S3]. Students under 18 are unlikely in undergraduate law programmes but cannot be excluded; verifiable parental consent applies to children's data [FACT][S3]. Whether educational institutions and their vendors benefit from specific exemptions for educational activities must be confirmed by counsel [NOT VERIFIED].

| Risk | Control (technical) | Policy |
|---|---|---|
| Student data exposure | Encryption; role-based access; per-institution data isolation; access logging | Data-processing agreement; retention limits; breach protocol |
| Voice recordings (later modules) | Not collected in MVP | Separate consent and retention policy before any voice feature |
| Use of student work to train AI | Contractual and technical: no training on institution data by default; provider terms checked | Written commitment in contract |
| Copyright in student work and legal sources | Store only what is needed; source licences respected | Counsel review of database licences and student IP terms |
| Cross-border transfer | Region selection; provider terms reviewed | Institutional approval and notice |

**Where qualified legal counsel is required**

(1) DPDP applicability, roles (fiduciary/processor) and children's-data treatment. (2) Licence terms for using legal databases in verification. (3) Student IP and consent terms. (4) Whether university statutes require academic-council approval for AI-assisted evaluation. (5) Contracts and limitation of liability. This report does not constitute legal advice.

## 11.2 What LexSkill AI is not

- Not a law firm; it provides no legal advice or representation.
- Not a replacement for faculty, examiners or legal databases.
- Not the final academic evaluator; institutions and examiners are.
- Not an automated hiring or admission decision-maker.

Suggested on-screen notice: *"This evaluation is an AI-assisted draft prepared for your examiner. Your final result is determined by your examiner. AI output may contain errors."*

# 12. Assessment Integrity

If an AI can help a student write a draft at home, a take-home drafting mark says little about the student's own skill. Singapore's law schools are responding in 2026 with more closed- or semi-closed-book and oral assessment [FACT][S13]; a UK law school is doing similarly [FACT][S27]. The same logic applies here [INFER]. LexSkill AI therefore supports several assessment modes:

| Mode | Description | Integrity strength |
|---|---|---|
| Supervised in-class | Timed task in a computer lab or moderated setting | High |
| Process-tracked | Draft written in platform editor; revision history retained | Medium (shows process, not honesty) |
| Open with disclosure | AI use permitted and disclosed; assessed on verification and judgement | Depends on task design |
| Formative practice | Ungraded feedback loop | Not applicable |

UGC's 2018 academic-integrity regulations focus on theses, dissertations and publications at Masters and research level and do not directly address undisclosed AI content [FACT][S21]. Institutions therefore set their own policies for coursework, and the platform provides configuration rather than a fixed rule. No AI-text detector is used to accuse students; detectors are unreliable for this purpose and are not part of the design [INFER].

# 13. Implementation at an Institution

| Phase | Weeks | Institution provides | LexSkill provides |
|---|---|---|---|
| Preparation | -2 to 0 | Faculty champion; course choice; data-protection sign-off; sample past submissions (anonymised, with permission) | Pilot agreement; data-processing terms; rubric workshop |
| Week 1: Onboarding | 1 | Student and faculty accounts; orientation slot | Configuration; training; rubric entry |
| Week 2: Student assessments | 2 | Cohort completes one drafting task (supervised recommended) | Support; monitoring |
| Week 3: Faculty evaluation | 3 | Two markers mark a sample independently; then review AI drafts | Agreement report; time logging |
| Week 4: Institutional report | 4 | Dean and faculty feedback session | Cohort report; pilot findings; go/no-go recommendation |

## Pilot success and failure criteria

These thresholds are proposals [ASSUMP]; they should be agreed in writing with the institution before the pilot starts.

| Measure | Success | Failure / stop |
|---|---|---|
| Faculty adoption | At least 80% of participating faculty finish reviewing all submissions in the platform | Fewer than 50% |
| Time per submission (review with AI vs. own unaided marking) | At least 30% less time, with faculty rating quality equal or better | No saving, or saving only by accepting AI marks unread |
| AI-faculty agreement (per criterion) | Agreement at least as high as between two faculty markers on the same criterion; criteria below this switched to faculty-only | Overall agreement clearly below human-human level |
| Citation verification | All flagged "not found" items resolved by faculty; no false "verified" on seeded fake citations | Any seeded fake citation marked verified |
| Student participation | At least 85% completion; majority find feedback useful | Below 60% completion |
| Institutional intent | Written intent to continue, or a paid extension | Only verbal praise, no commitment |

## 12-month institutional rollout (illustrative)

After a successful pilot: extend to all drafting courses in one programme (months 2-4); add a second skill only if the pilot shows a need (months 5-8); first institution-wide report for the academic council at end of year 1 (months 9-12). Cost, contract terms and procurement route are covered in the companion study.

# 14. Institutional Benefits and How to Read the Analytics

- **Faculty.** A structured first read; less repetitive marking; comparable scores across sections. Measured, not assumed.
- **Students.** Earlier, itemised feedback; a record of progress; practice in verifying authorities.
- **Deans and heads.** Batch-level view of skill patterns; evidence for internal reviews and outcome reporting.
- **Placement cells (later).** Anonymised skill evidence to guide preparation. Not a predictor of job performance.

**Cautions on analytics**
Scores are only as valid as the rubrics behind them. Cohort comparisons across sections or colleges are meaningful only after rubric and marker calibration. Dashboards will show sample sizes and agreement levels beside every figure, and will not rank individual students or faculty without explicit institutional policy.

# 15. Five-Minute Demonstration Plan

The demonstration is built on synthetic data; no real student work is shown.

| # | Screen | Time | What the presenter says |
|---|---|---|---|
| 1 | Dean dashboard | 0:00 | "This is what an institution sees: skills across a cohort, with sample sizes. Every figure comes from faculty-approved marks." |
| 2 | Faculty creates assessment | 0:40 | "The teacher writes the task and the rubric. The rubric is the teacher's, not ours." |
| 3 | Student receives assignment | 1:05 | "Students see the task and the integrity mode chosen by the teacher." |
| 4 | Student submits | 1:25 | "A drafted legal notice, in the platform editor." |
| 5 | AI evaluates | 1:50 | "The AI drafts comments against each rubric line and quotes the passage it relies on. It says where it is not confident." |
| 6 | Citation verification | 2:25 | "Each authority is checked. One case is real but does not say what the student claims. One does not exist." |
| 7 | Faculty overrides score | 3:00 | "The teacher disagrees with one comment and changes the mark. The system records the change and the reason." |
| 8 | Student skill profile | 3:40 | "The student sees only finalised results, with feedback." |
| 9 | Institutional analytics | 4:05 | "Aggregated and anonymised: citation accuracy is the weakest area in this batch." |
| 10 | Report generation | 4:35 | "One click gives the academic council a report, with the limits stated on the page." |

# 16. Explaining LexSkill AI to a Judge or Senior Advocate

**In 30 seconds.** "Law students are taught drafting and advocacy, but marking those skills is slow and uneven. This tool helps the teacher: it prepares a first assessment and checks whether the cases cited are real and support the point. The teacher decides the marks. It is designed so that no student learns to trust an unverified citation."

**In 2 minutes.** Add: "Courts have said that citing fabricated AI judgments is misconduct. Students need to practise verification before they enter chambers. The system flags each authority as verified, mismatched, unsupported or not found, and the teacher sees the evidence. AI is not used to decide anything about a student; it prepares material for the examiner, and everything is logged so a grievance can be reviewed."

**In 5 minutes.** Add: the evidence for and against AI marking (a US study shows close agreement with professors when rubrics are detailed; that has not yet been tested on Indian drafting), the integrity problem of take-home work and the assessment modes that address it, data protection, and the fact that the project is at the validation stage: it will proceed only if faculty confirm it saves time without lowering quality. Invite the judge's view on what a graduate must be able to do unaided in the first year at the Bar, since rubrics should reflect that.

# 17. Open Questions and Limits of this Report

- No Indian study of AI assessment of drafting or moot tasks was found in this research pass [NOT VERIFIED].
- Indian legal-source access and licence terms for automated verification are unresolved [NOT VERIFIED].
- Institutional interest and willingness to pay are unvalidated; see the Business & Feasibility Study [ASSUMP].
- Details of the 2026 Supreme Court judgments and the draft AI-in-courts regulations are taken from secondary reports [NOT VERIFIED].
- The BCI committee on AI guidelines directed in 2026 has not been reviewed; its output may change norms for law-school use of AI [NOT VERIFIED].

# Glossary

| Term | Meaning |
|---|---|
| ACV | Annual contract value |
| BCI | Bar Council of India |
| DPDP | Digital Personal Data Protection Act 2023 and Rules 2025 |
| LLM | Large language model |
| RAG | Retrieval-augmented generation: the model answers using retrieved source text |
| Rubric | Faculty-written marking criteria with score-band descriptors |

# Source Register

*Reliability grades: High = primary/official or peer-reviewed; Medium = reputable secondary; Low = commercial, SEO or aggregator content. "Company claim" figures are independently unverified.*

| ID | Source | Organisation | Publication / date | URL | Claim supported | Reliability |
